5.Project Development phase

Introduction

The Development Phase is the stage where the Auto Ticket Classification system is actually built and configured using ServiceNow Flow Designer. The main goal is to automatically classify incoming tickets based on their description and assign them to the appropriate category, priority, and support group.

Development Process

1.Create the Flow

Open ServiceNow → Flow Designer.

Create a new flow named Auto Ticket Classification.

2.Configure the Trigger Select

the Incident table.

Set the trigger to run when a new incident/ticket is created.

3.Get Ticket Details

Read important fields such as:

Short Description

Description

Caller

Category

Priority

4. Add Classification Conditions

Use If/Else conditions to identify the ticket type.

Example:

“Password reset” → Access/Password

“Laptop not working” → Hardware

“Application error” → Software

“Network connection problem” → Network

5. Update the Ticket

Use the Update Record action.

Automatically update the appropriate:

Category

Subcategory

Assignment Group

Priority

6.Test the Flow

Create sample incident tickets.

Check whether the Flow Designer correctly classifies and assigns each ticket.

Correct the conditions if any classification is incorrect.

Example Flow

New Incident Created → Read Description → Check Conditions → Identify Category → Set Assignment Group/Priority → Update Incident → End
