2.Requirement Analysis

1. Introduction

Requirement analysis is the first important step in developing an **Auto Ticket Classification system using ServiceNow Flow Designer**. The purpose is to identify the requirements needed to automatically classify incoming tickets based on their information.

2. Functional Requirements

1. **Ticket Creation** ○ The system should receive newly created incidents or service tickets.
    - Ticket details such as **Short Description, Description, Category and Priority** should be captured.
2. **Ticket Classification** ○ Flow Designer should analyze the ticket information.
    - Tickets should be classified into appropriate categories such as:
        - Hardware
        - Software
        - Network
        - Access/Account
        - Other
3. **Automatic Assignment**
    - Based on the classification, the ticket should be assigned to the appropriate **Assignment Group**.
4. **Priority Identification**
    - The system can determine or update ticket priority based on predefined conditions.
5. **Notification**
    - Notifications can be sent to the assigned team when a ticket is classified and assigned.
6. **Record Update**
    - The classified category, assignment group and other relevant fields should automatically be updated in the ticket.

3. Non-Functional Requirements

- **Accuracy:** Tickets should be classified according to predefined rules.
- **Performance:** Classification should happen quickly after ticket creation.
- **Reliability:** The flow should execute consistently without losing ticket information.
- **Security:** Only authorized users should access and modify ticket information.
- **Scalability:** The flow should support increasing numbers of tickets.

4. Input Requirements

The system mainly requires:

- Ticket Number
- Short Description
- Description
- Category
- Subcategory
- Priority
- Caller/User details

5. Output Requirements

After processing, the system should produce:

New Ticket → Classification → Category/Subcategory → Assignment Group → Priority → Notification

6. Flow Designer Requirement The

basic Flow Designer flow can be:

Trigger:

Incident/Ticket is created

↓

Get Ticket Details

↓

Apply Classification Conditions

↓

Set Category & Subcategory

↓

Set Assignment Group

↓

Update Ticket

↓

Send Notification
